Opening layout and camera

The opening woodland

Arrival

The request

The repaired crossing

The existing route reaches both neighbours; the timber repair adds their direct shortcut. Map labels are adult planning annotations.

Help, leaving and return

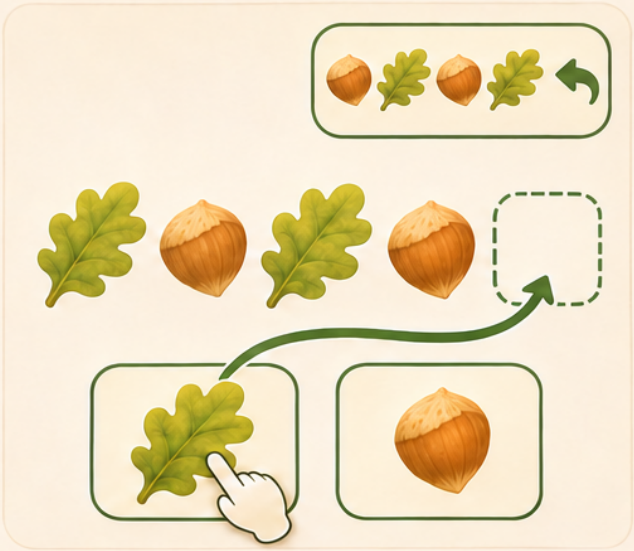

Hare first

Hear it again

Watch again

Leave for now

Continue later

Return after helping

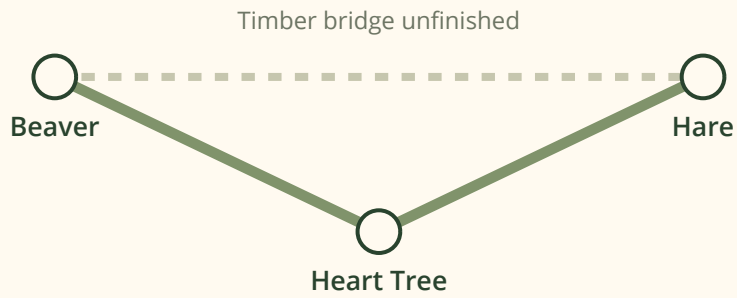

Repeat the instruction or a separate demonstration; return safely, continue later, and keep completed help. These are concept states.

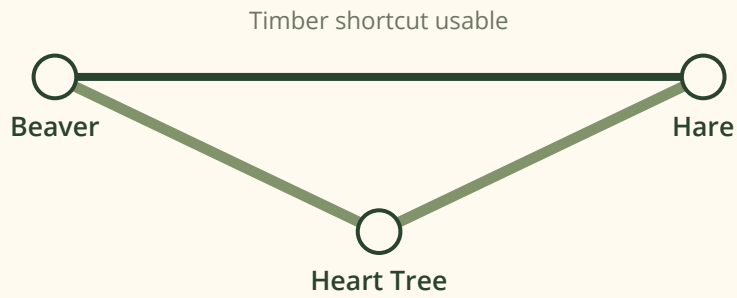

What the first playable slice needs to demonstrate

One short shared quest, two existing approaches, and a visible lasting connection.

Before helping

After helping

Connectivity diagrams are schematic. The garden approach uses the existing broad stone-and-earth crossing.

Picture-led play

Either neighbour leads to the same bridge request.

Spoken guidance and a separate example teach the action; live answers remain unmarked.

The place picture returns to Beaver. Leaving an unfinished task remains a welcome route.

Durable progress

Round success counts even when its learning star was earned before.

Save the repair once before celebration. Interruptions never undo the completed bridge.

Exact question restoration requires an activity snapshot; safe-place and level recovery remain explicit.

Next phase

After a build instruction, create the local Three.js opening with one existing flat activity. Then observe movement, real speech, help, return and the bridge payoff on the intended device before expanding the forest.
